

## **Amari Launches Metals Database**

A regular exhibitor at the Farnborough Airshow, Amari Aerospace (Hall 2, Stand C22) will use the 2010 key industry event to demonstrate its recently upgraded website.

Extending its reputation for exceptional service in the aerospace metal distribution industry, Amari Aerospace's recently upgraded website now includes a searchable aircraft metals database. General Manager, Dave Enright, explains the concept behind the added web-based functionality; "Websites should be practical as well as informative. The new database is accessible from the home page, and users can quickly select an aerospace material specification and view its basic properties online, or download it as a printable PDF file."

The site already holds hundreds of specifications including Aluminium, Steel, Titanium, Nickel, and Copper Alloy grades, covering around 85 per cent of the most widely used metals in the industry. Amari Aerospace is committed to continually updating the list and a much wider range of the commercially available alloys will be added to the database ongoing.

As well as a brief technical description of the alloy, chemical composition, alloy designations and available tempers, Amari Aerospace's data sheet includes extras such as typical applications and structure. Amari supplies the vast majority of these materials in bar, plate, sheet, tube and forgings to meet customers' deliver on demand requirements.

The new website will also feature a metals weight calculator that will allow engineers and buyers to input alloy type, form and size to return an exact figure for the theoretical weight of the raw material required.

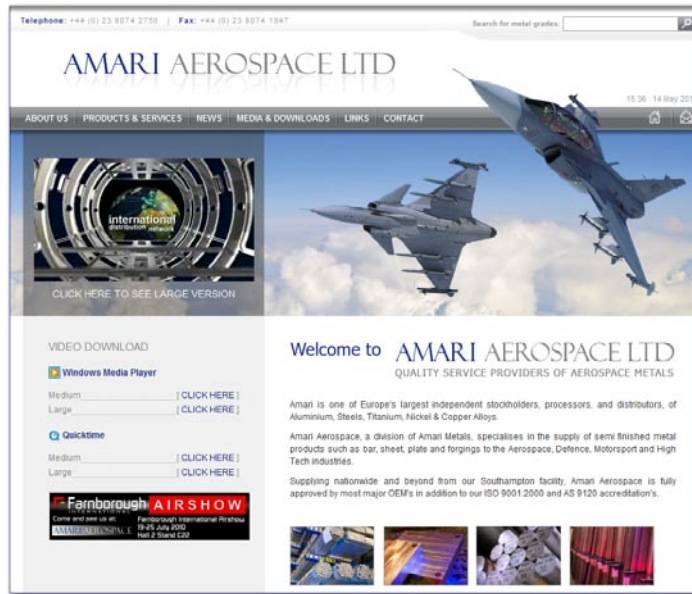

"We are a young and progressive company and we are mindful that the customer always has a choice where to buy," Dave Enright states. "We benefit from the strength of our global organisation, however we always maintain the high personal and local service levels that our customer base expects, and Farnborough visitors can experience this firsthand at the airshow."

**Note to Editors**

Amari Aerospace is a fast growing subsidiary of the UK's largest independent multi-metals stockholder, with an extensive inventory of aluminium, steels, titanium, copper and nickel alloys in all semi-finished forms. By providing customers with a cost-effective single source for all their metals requirements, over 50 per cent of Amari sales consist of non-standard products.
